Target Details

Target Type:	Antibody			
Background:	Synonyms: Goat Anti-Rat IgG rhodamine Conjugated Antibody, Goat Anti-Rat IgG Antibody			
	TRITC Conjugation			
	Background: Anti-Rat IgG (H&L) rhodamine Antibody generated in goat detects reactivity to Rat			
	IgG. Secreted as part of the adaptive immune response by plasma B cells, immunoglobulin G			
	constitutes 75 % of serum immunoglobulins. Immunoglobulin G binds to viruses, bacteria, as			
	well as fungi and facilitates their destruction or neutralization via agglutination (and thereby			
	immobilizing them), activation of the compliment cascade, and opsinization for phagocytosis.			
	The whole IgG molecule possesses both the F(c) region, recognized by high-affinity Fc receptor			
	proteins, as well as the F(ab) region possessing the epitope-recognition site. Both the Heavy			
	and Light chains of the antibody molecule are present. Secondary Antibodies are available in a			
	variety of formats and conjugate types. When choosing a secondary antibody product,			
	consideration must be given to species and immunoglobulin specificity, conjugate type,			
	fragment and chain specificity, level of cross-reactivity, and host-species source and fragment			
	composition. This Anti-Rat IgG is conjugated to rhodamine.
