## .-online.com antibodies

# Datasheet for ABIN1029058 Kallikrein 10 ELISA Kit

Overview

Quantity:	96 tests
Target:	Kallikrein 10 (KLK10)
Reactivity:	Human
Method Type:	Sandwich ELISA
Detection Range:	0.156 ng/mL - 10 ng/mL
Minimum Detection Limit:	0.156 ng/mL
Application:	ELISA
Product Details	
Purpose:	The kit is a sandwich enzyme immunoassay for the in vitro quantitative measurement of KLK10 in human serum, plasma, tissue homogenates, cell lysates, cell culture supernates and other biological fluids.
Sample Type:	Cell Culture Supernatant, Cell Lysate, Plasma, Serum, Tissue Homogenate
Analytical Method:	Quantitative
Detection Method:	Colorimetric
Specificity:	This assay has high sensitivity and excellent specificity for detection of this index.
Cross-Reactivity (Details):	No significant cross-reactivity or interference between this index and analogues was observed. Note: Limited by current skills and knowledge, it is impossible for us to complete the cross- reactivity detection between this index and all the analogues, therefore, cross reaction may still exist.
Sensitivity:	0.048 ng/mL

#### Product Details

Components:	Pre-coated, ready to use 96-well strip plate
	Standard (freeze dried)
	Standard Diluent
	Detection Reagent A
	Detection Reagent B
	Assay Diluent A
	Assay Diluent B
	• TMB
	Stop Solution
	• Wash Buffer (30X)
	Plate sealer for 96 wells
	Instruction manual
Material not included:	1. Microplate reader with 450 ± 10nm filter.
	2. Precision single or multi-channel pipettes and disposable tips.
	3. Eppendorf Tubes for diluting samples.
	4. Deionized or distilled water.
	5. Absorbent paper for blotting the microtiter plate.
	6. Container for Wash Solution.

### Target Details

Target:	Kallikrein 10 (KLK10)
Alternative Name:	KLK10 (KLK10 Products)
Background:	Alternative name: NES1, PRSSL1, Kallikrein-Related Peptidase 10, Normal epithelial cell-specific 1, Protease serine-like 1
Gene ID:	5655
UniProt:	043240
Pathways:	Complement System

#### Application Details

Sample Volume:	100 µL
Assay Time:	1 - 4.5 h
Plate:	Pre-coated
Protocol:	1. Prepare all reagents, samples and standards
	2. Add 100µL standard or sample to each well. Incubate 2 hours at 37°C

Order at www.antibodies-online.com | www.antikoerper-online.de | www.anticorps-enligne.fr | www.antibodies-online.cn International: +49 (0)241 95 163 153 | USA & Canada: +1 877 302 8632 | support@antibodies-online.com Page 2/7 | Product datasheet for ABIN1029058 | 09/12/2023 | Copyright antibodies-online. All rights reserved.

	3. Aspirate and add 100 $\mu$ L prepared Detection Reagent A. Incubate 1 hour at 37°C
	4. Aspirate and wash 3 times
	5. Add 100µL prepared Detection Reagent B. Incubate 1 hour at 37°C
	6. Aspirate and wash 5 times
	7. Add 90µL Substrate Solution. Incubate 15-25 minutes at 37°C
	8. Add 50µL Stop Solution. Read at 450nm immediately.
Sample Collection:	Serum - Use a serum separator tube (SST) and allow samples to clot for 30 minutes before
	centrifugation for 15 minutes at approximately 1000 $ imes$ g. Remove serum and assay
	immediately or aliquot and store samples at -20 °C or -80 °C. Plasma - Collect plasma using
	EDTA or heparin as an anticoagulant. Centrifuge samples for 15 minutes at 1000 × g at 2 °C - 8
	°C within 30 minutes of collection. Store samples at -20 °C or -80 °C. Avoid repeated freeze-
	thaw cycles. Tissue homogenates - The preparation of tissue homogenates will vary depending
	upon tissue type. For this assay, tissue was rinsed with 1X PBS to remove excess blood,
	homogenized in 20 mL of 1X PBS and stored overnight at ≤ -20 °C After two freeze-thaw cycles
	were performed to break the cell membranes, the homogenates were centrifuged for 5 minutes
	at 5000 x g. Remove the supernate and assay immediately or aliquot and store at $\leq$ -20 °C. Cell
	culture supernates and Other biological fluids - Remove particulates by centrifugation and
	assay immediately or aliquot and store samples at -20 °C or -80 °C. Avoid repeated freeze-thaw
	cycles.
	Note:
	1. Samples to be used within 5 days may be stored at 2-8 °C , otherwise samples must stored
	at -20 °C (1 month) or -80 °C (2 months) to avoid loss of bioactivity and contamination.
	2. Tissue or cell extraction samples prepared by chemical lysis buffer may cause unexpected
	ELISA results due to the impacts of certain chemicals.
	3. Influenced by the factors including cell viability, cell number and also sampling time, samples
	from cell culture supernatant may not be detected by the kit
	4. Sample hemolysis will influence the result, so hemolytic specimen can not be detected.
	5. When performing the assay slowly bring samples to room temperature.
Sample Preparation:	Allow all reagents to reach room temperature (Please do not dissolve the reagents at 37 °C
oumple rieparation.	directly.). All the reagents should be mixed thoroughly by gently swirling before pipetting. Avoid
	foaming. Keep appropriate numbers of strips for 1 experiment and remove extra strips from
	microtiter plate. Removed strips should be resealed and stored at 4 °C until the kits expiry date.
	Prepare all reagents, working standards and samples as directed in the previous sections.
	Please predict the concentration before assaying. If values for these are not within the range of
	the standard curve, users must determine the optimal sample dilutions for their particular
	the standard curve, users must determine the optimal sample dilutions for their particular

#### experiments.

1. Add 100  $\mu L$  of Standard, Blank, or Sample per well. Cover with the Plate sealer. Incubate for 2 hours at 37 °C.

2. Remove the liquid of each well, don't wash. Add 100 µL of Detection Reagent A working solution to each well. Cover with the Plate sealer. Incubate for 1 hour at 37 °C. Detection Reagent A working solution may appear cloudy. Warm to room temperature and mix gently until solution appears uniform.

3. Aspirate each well and wash, repeating the process three times for a total of three washes. Wash by filling each well with Wash Buffer (approximately 400 µL) using a squirt bottle, multichannel pipette, manifold dispenser or autowasher. and let it sit for 1~2 minutes. Complete removal of liquid at each step is essential to good performance. After the last wash, remove any remaining Wash Buffer by aspirating or decanting. Invert the plate and blot it against clean paper towels.

4. Add 100  $\mu$ L of Detection Reagent B working solution to each well. Cover with a new Plate sealer. Incubate for 1 hour at 37 °C.

5. Repeat the aspiration/wash process for 5 times as conducted in step 3.

6. Add 90  $\mu$ L of Substrate Solution to each well. Cover with a new Plate sealer. Incubate within 15-30 minutes at 37 °C. Protect from light.

7. Add 50  $\mu$ L of Stop Solution to each well. If color change does not appear uniform, gently tap the plate to ensure thorough mixing.

8. Determine the optical density of each well at once, using a microplate reader set to 450 nm. Note:

1. Absorbance is a function of the incubation time. Therefore, prior to starting the assay it is recommended that all reagents should be freshly prepared prior to use and all required stripwells are secured in the microtiter frame. This will ensure equal elapsed time for each pipetting step, without interruption.

 Please carefully reconstitute Standards or working Detection Reagent A and B according to the instruction, and avoid foaming and mix gently until the crystals have completely dissolved. The reconstituted Standards Detection Reagent A and B can be used only once. This assay requires pipetting of small volumes. To minimize imprecision caused by pipetting, ensure that pipettors are calibrated. It is recommended to suck more than 10µL for once pipetting.
 To ensure accurate results, proper adhesion of plate sealers during incubation steps is necessary. Do not allow wells to sit uncovered for extended periods between incubation steps. Once reagents have been added to the well strips, DO NOT let the strips DRY at any time during the assay.

4. For each step in the procedure, total dispensing time for addition of reagents to the assay

	plate should not exceed 10 minutes.
	5. To avoid cross-contamination, change pipette tips between additions of each standard level,
	between sample additions, and between reagent additions. Also, use separate reservoirs for
	each reagent.
	6. The wash procedure is critical. Insufficient washing will result in poor precision and falsely
	elevated absorbance readings.
	7. Duplication of all standards and specimens, although not required, is recommended.
	8. Substrate Solution is easily contaminated. Please protect it from light.
	9. The web version of manual is only for reference, subject to the instruction shipping with the
	kit.
Assay Procedure:	The microtiter plate provided in this kit has been pre-coated with an antibody specific to the
	index. Standards or samples are then added to the appropriate microtiter plate wells with a
	biotin-conjugated antibody preparation specific to the index. Next, Avidin conjugated to
	Horseradish Peroxidase (HRP) is added to each microplate well and incubated. After TMB
	substrate solution is added, only those wells that contain the index, biotin-conjugated antibody
	and enzyme-conjugated Avidin will exhibit a change in color. The enzyme-substrate reaction is
	terminated by the addition of sulphuric acid solution and the color change is measured
	spectrophotometrically at a wavelength of 450nm $\pm$ 10nm. The concentration of the index in
	the samples is then determined by comparing the O.D. of the samples to the standard curve.
Calculation of Results:	Average the duplicate readings for each standard, control, and sample and subtract the average
	zero standard optical density. Create a standard curve by reducing the data using computer
	software capable of generating a four parameter logistic (4-PL) curve-fit. As an alternative,
	construct a standard curve by plotting the mean absorbance for each standard on the x-axis
	against the concentration on the y-axis and draw a best fit curve through the points on the
	graph. The data may be linearized by plotting the log of the Kallikrein-10 concentrations versus
	the log of the O.D. and the best fit line can be determined by regression analysis. It is
	recommended to use some related software to do this calculation, such as curve expert 1.3.
	This procedure will produce an adequate but less precise fit of the data. If samples have been
	diluted, the concentration read from the standard curve must be multiplied by the dilution
	factor.
	Important note:
	1. Limited by the current condition and scientific technology, we can't completely conduct the
	comprehensive identification and analysis on the raw material provided by suppliers. So there
	might be some qualitative and technical risks to use the kit
	2. The final experimental results will be closely related to validity of the products, operation

10. Each kit has been strictly p	periment before assay for each batch is recommended.
	passed Q.C test. However, results from end users might be
inconsistent with our in-house	e data due to some unexpected transportation conditions or
different lab equipments. Intra	a-assay variance among kits from different batches might arise
from above factors, too.	
11. Kits from different manufa	acturers for the same item might produce different results, since
we haven't compared our pro-	ducts with other manufacturers.
12. The instruction manual al	so suit for the kit of 48T, but all reagents of 48T kit is reduced by
half.	
13. Valid period: six months.	
Assay Precision: Intra-assay Precision (Preci	ision within an assay): 3 samples with low, middle and high level
the index were tested 20 tir	mes on one plate, respectively.
	ision between assays): 3 samples with low, middle and high level

<ul> <li>Intra-assay: CV&amp;lt10%</li> </ul>	
Inter-assay: CV&It12%	
Restrictions: For Research Use only	

Handling	
Precaution of Use:	The Stop Solution suggested for use with this kit is an acid solution. Wear eye, hand, face, and clothing protection when using this material.
Handling Advice:	The stability of ELISA kit is determined by the loss rate of activity. The loss rate of this kit is less than 5 % within the expiration date under appropriate storage conditions. Note: To minimize unnecessary influences on the performance, operation procedures and lab conditions, especially room temperature, air humidity and incubator temperatures should be strictly regulated. It is also strongly suggested that the whole assay is performed by the same experimenter from the beginning to the end.
Storage:	4 °C,-20 °C
Storage Comment:	The Assay Plate, Standard, Detection Reagent A and Detection Reagent B should be stored at -20°C upon being received. After receiving the kit , Substrate should be always stored at 4°C.Other reagents are kept according to the labels on vials. But for long term storage, please keep the whole kit at -20°C. The unused strips should be kept in a sealed bag with the desiccant provided to minimize exposure to damp air. The test kit may be used throughout the expiration date of the kit (six months from the date of manufacture). Opened test kits will remain stable until the expiring date shown, provided it is stored as prescribed above.
Expiry Date:	12 months
