

Datasheet for ABIN1112703 **VEGFC ELISA Kit**

Overview

Quantity:	96 tests
Target:	VEGFC
Reactivity:	Human
Method Type:	Sandwich ELISA
Detection Range:	31.2-2000 pg/mL
Minimum Detection Limit:	31.2 pg/mL
Application:	ELISA

Product Details

Purpose:	For quantitative detection of VEGF-C in human serum, plasma, body fluids, tissue lysates or cell culture supernatants.
Sample Type:	Cell Culture Supernatant, Plasma, Serum, Tissue Lysate
Analytical Method:	Quantitative
Detection Method:	Colorimetric
Sensitivity:	< 3 pg/mL
Components:	1. One 96-well plate pre-coated with anti-Human VEGF-C antibody 2. Lyophilized Human VEGF- C standards: 2 tubes (10ng / tube) 3. Sample / Standard diluent buffer: 30ml 4. Biotin conjugated anti-Human VEGF-C antibody (Concentrated): 130 μl.
Material not included:	1. 37 °C incubator 2. Microplate reader (wavelength: 450nm) 3. Precise pipette and disposable pipette tips 4. Automated plate washer 5. ELISA shaker 6. 1.5ml of Eppendorf tubes 7. Plate cover 8. Absorbent filter papers 9. Plastic or glass container with volume of above 1L

Target Details

Target:	VEGFC
Alternative Name:	VEGF-C (VEGFC Products)
Background:	Vascular endothelial growth factor C (VEGF-C) is a member of the platelet-derived growth
	factor/vascular endothelial growth factor (PDGF/VEGF) family. It is active in angiogenesis,
	lymphangiogenesis and endothelial cell growth and survival, and can also affect the
	permeability of blood vessels. This secreted protein undergoes a complex proteolytic
	maturation, generating multiple processed forms that bind and activate VEGFR-3 receptors.
	Karkkainen et al. (2004) found that VEGFC and VEGF, unlike VEGFB and VEGFD, are essential
	for embryonic survival and lymphangiogenesis.
Pathways:	RTK Signaling, Signaling Events mediated by VEGFR1 and VEGFR2

Application Details

Comment:	This kit was based on sandwich enzyme-linked immune-sorbent assay technology. Anti-VEGF-C
	polyclonal antibody was pre-coated onto 96-well plates. And the biotin conjugated anti-VEGF-C
	polyclonal antibody was used as detection antibodies. The standards test samples and biotin
	conjugated detection antibody were added - the wells subsequently and wash with wash buffer.
	Avidin-Biotin-Peroxidase Complex was added and unbound conjugates were washed away with
	wash buffer. TMB substrates were used - visualize HRP enzymatic reaction. TMB was
	catalyzed by HRP - produce a blue color product that changed into yellow after adding acidic
	stop solution. The density of yellow is proportional - the VEGF-C amount of sample captured in
	plate. Read the O.D. absorbance at 450 nm in a microplate reader and then the concentration of
	VEGF-C can be calculated.
Plate:	Pre-coated

Application Details	
Sample Preparation:	Preparation of sample and reagents 1. Sample Isolate the test samples soon after collecting,
	then, analyze immediately (within 2 hours). Or aliquot and store at -20 $^\circ C$ for long term. Avoid
	multiple freeze-thaw cycles.
	Cell culture supernatants: Centrifuge to remove precipitate, analyze immediately or aliquot and
	store at -20 °C .
	Serum: Coagulate the serum at room temperature (about 4 hours). Centrifuge at approximately
	1000 × g for 15 min. Analyze the serum immediately or aliquot and store at -20 $^\circ\mathrm{C}$.
	Plasma: Collect plasma with heparin or EDTA as the anticoagulant. Centrifuge for 15 min at
	1000 x g within 30 min of collection. Analyze immediately or aliquot and store frozen at -20 $^\circ$ C.
	Citrate can not be used as anticoagulant here. Note: 1. Coagulate blood samples completely,
	then, centrifuge, and avoid hemolysis and particle. 2. NaN3 can not be used as test sample
	preservative, since it is the inhibitor for HRP.
Restrictions:	For Research Use only
Handling	
Preservative:	Sodium azide, Thimerosal (Merthiolate)
