## Datasheet for ABIN117942 anti-ANAPC2 antibody (C-Term)

1 Image

Publication

1

### Overview

Quantity:	0.1 mL
Target:	ANAPC2
Binding Specificity:	AA 810-822, C-Term
Reactivity:	Human
Host:	Rabbit
Clonality:	Polyclonal
Conjugate:	This ANAPC2 antibody is un-conjugated
Application:	Western Blotting (WB), Enzyme Immunoassay (EIA), Immunoprecipitation (IP)
Product Details	
Immunogen:	This antibody was prepared from whole rabbit serum produced by repeated immunizations
	with a synthetic peptide corresponding to amino acids 810-822 of Human APC2 (C- terminal)
	coupled to KLH.
Sequence:	
	Human APC2 (822 aa 93.8 kDa): 1 maaavvvaeg dsdsrpgqel lvawntvstg lvppaalglv ssrtsgavpp

Specificity:	This product is monospecific antiserum processed by delipidation and defibrination followed by
	sterile filtration. This antibody reacts with human APC2. Cross reactivity may also occur with
	APC2 from other sources. Sufficient sequence differences exist to suggest that this antibody
	would not react with other RING box proteins such as ROC1 and ROC2.
Purification:	Delipidation and defibrination.

## Target Details

Target:	ANAPC2
Alternative Name:	APC2 / ANAPC2 (ANAPC2 Products)
Background:	APC2, also known as Anaphase promoting complex subunit 2, APC2, Cyclosome subunit 2, and ANAPC2, is a component of the anaphase promoting complex/cyclosome (APC/C), a cell cycle-regulated E3 ubiquitin ligase that controls progression through mitosis and the G1 phase of the cell cycle. The APC/cyclosome protein complex promotes metaphase-anaphase transition by ubiquitinating its specific substrates such as mitotic cyclins and anaphase inhibitors, which are subsequently degraded by the 26S proteasome. Biochemical studies have shown that the vertebrate APC contains at least eleven subunits. The composition of APC is highly conserved in organisms from yeast to humans. APC2 is a cullin family member that interacts through the cullin domain with ANAPC11 and UBCH10.Synonyms: Anaphase-promoting complex subunit 2, Cyclosome subunit 2, KIAA1406
Gene ID:	29882
NCBI Accession:	NP_037498
UniProt:	Q9UJX6
Pathways:	Regulation of Cell Size

## Application Details

Application Notes:	Western blot (1: 500-1: 1,000). Immunoprecipitation: The antibody immunoprecipitates in vitro
	translated protein andprotein from overexpressing cell lysates (using HeLa and NIH-3T3, and
	others. Coimmunoprecipitation of related proteins (APC11) does occur. A 93.8 kDa
	bandcorresponding to human APC2 is detected. Most cell lines or tissues expressing APC2
	canbe used as a positive control. ELISA (1: 2,000-1: 10,000).

Application Details		
	Other applications not tested. Optimal dilutions are dependent on conditions and should be determined by the user.	
Restrictions:	For Research Use only	
Handling		
Format:	Liquid	
Concentration:	85 mg/mL (by Refractometry)	
Handling Advice:	Avoid repeated freezing and thawing. This product is photosensitive and should be protected from light	
Storage:	4 °C/-20 °C	
Storage Comment:	Store undiluted at 2-8 °C for one month or (in aliquots) at -20 °C for longer.

**Image 1.** Conjugation pathways for ubiquitin and ubiquitinlike modifiers (UBLs). Most modifiers mature by proteolytic processing from inactive precursors (a, amino acid). Arrowheads point to the cleavage sites. Ubiquitin is expressed either as polyubiquitin or as a fusion with ribosomal proteins. Conjugation requires activating (E1) and conjugating (E2) enzymes that form thiolesters (S) with the modifiers. Modification of cullins by RUB involves SCF(SKP1/cullin-1/F-box protein) /CBC(cullin-2/elongin B/elonginC) -like E3 enzymes that are also involved in ubiquitination. In contrast to ubiquitin, the UBLs do not seem to form multi-UBL chains. UCRP(ISG15) resembles

two ubiquitin moieties linked headto- tail. Whether HUB1 functions as a modifier is currently unclear. APG12 and URM1 are distinct from the other modifiers because they are unrelated in sequence to ubiquitin. Data contributed by S.Jentsch, see references below.
