## Target Details

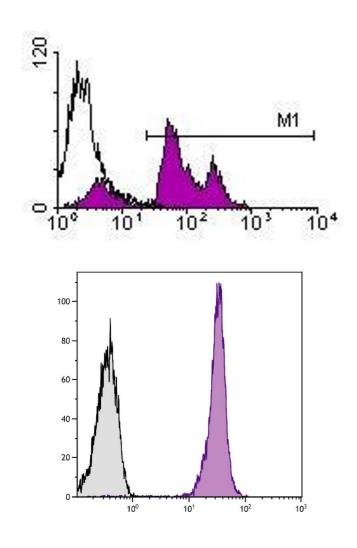

Background:	The CD45 antigen is an essential regulator of leukocyte activation and development, and is now
	known to be a protein tyrosine phosphatase, e.g. CD45 is able to dephosporylate the Src family
	of protein kinases. This activity is now known to be required for signal transduction induced by
	T and B cell antigen receptor engagement, cytokine signaling and Fc receptor stimulation. The
	functional state of CD45 also has a pronounced effect on lymphocyte development. CD45
	exists in multiple forms, such as the restricted variants (CD45R) and as allelic forms CD45.1/Ly-
	5.1 and CD45.2/Ly-5.2. The specificity of antibodies to CD45.1 and CD45.2 has been exploited
	in studies where resolution of donor and recipient cells is essential, such as in gene therapy or
	bone marrow transplantation.
