	Embryonic large molecule derived from yolk sac, MST108, MSTP108, Protein ELYS, Protein
	MEL-28, Putative AT-hook-containing transcription factor 1, TMBS62.
	Background: ELYS is a protein of the nuclear matrix that contains one AT hook DNA-binding
	domain. ELYS is a dual nucleoporin/kinetochore protein required for nuclear pore assembly and
	proper cell division. Nuclear pores span the nuclear envelope and act as gated aqueous
	channels to regulate the transport of macromolecules between the nucleus and cytoplasm,
	from individual proteins and RNAs to entire viral genomes. The A.T. hook near the C-terminus of
	likely indicates ELYS can function as a transcription factor which may play a specific role in
	hematopoietic tissues. It also may play a role in early embryo development, as ELYS is critical
	for the survival of inner cells of the blastocyst.
