repress transcription of SRF in vitro and hence may play a role in heart	
development. Transcription factor 25, is a 676 amino acid protein that plays a role in cell death.	
A member of the TCF25 family, Nulp1 utilizes its C-terminus to mediate transcriptional	
repression of SRF in vitro, and interacts with XIAP. Nulp1 localizes primarily to the nucleus but	
is also found in cytosol. Widely expressed, Nulp1 is found at high levels in embryonic brain and	
adult heart. The gene encoding Nulp1 maps to human chromosome 16, which encodes over	
900 genes and comprises nearly 3 % of the human genome. The GAN gene is located on	
chromosome 16 and, with mutation, may lead to giant axonal neuropathy, a nervous system	
disorder characterized by increasing malfunction with growth. The rare disorder Rubinstein-	
Taybi syndrome is also associated with chromosome 16, as is Crohn's disease, which is a	
gastrointestinal inflammatory condition.
