	as three alternatively spliced isoforms, the PTD015 gene is conserved in dog, cow, mouse, rat,
	chicken and zebrafish, and maps to human chromosome 11q14.1. With approximately 135
	million base pairs and 1,400 genes, chromosome 11 makes up around 4 % of human genomic
	DNA and is considered a gene and disease association dense chromosome. The chromosome
	11 encoded Atm gene is important for regulation of cell cycle arrest and apoptosis following
	double strand DNA breaks. Atm mutation leads to the disorder known as ataxia-telangiectasia.
	The blood disorders Sickle cell anemia and thalassemia are caused by HBB gene mutations.
	Wilms' tumors, WAGR syndrome and Denys-Drash syndrome are associated with mutations of
	the WT1 gene. Jervell and Lange-Nielsen syndrome, Jacobsen syndrome, Niemann-Pick
	disease, hereditary angioedema and Smith-Lemli-Opitz syndrome are also associated with
	defects in chromosome 11. The PTD015 gene product has been provisionally designated
	PTD015 pending further characterization.
UniProt:	Q9H7C9
