Background:	Synonyms: Factor for adipocyte dferentiation 104, FAD104, fibronectin type III domain
	containing 3B, FLJ23399, HCV NS5A binding protein 37, NS5ABP37, YVTM2421, MGC10002,
	PRO4979, DKFZp686D14170, DKFZp762K137, FND3B_HUMAN.
	Background: Adipogenesis, the process of transforming pre-adipocytes into mature fat cells, is
	of particular interest due to the role adipocytes play in obesity and type II diabetes. Adipocytes
	have been shown to affect a variety of functions, including hemostasis, angiogenesis and
	energy balance, by secreting hormones and bioactive peptides. The FNDC3B protein, also
	designated FAD104 (factor for adipocyte differentiation 104) or HCV NS5A-binding protein 37,
	is expressed during early adipogenesis. Belonging to the FNDC3 family of proteins, FNDC3B is a
	1,204 amino acid protein that contains nine fibronectin type-III domains. FNDC3B-deficient
	mice die within one day of birth, suggesting that FNDC3B is crucial for postpartum survival.
	Mouse embryonic fibroblasts (MEFs) with loss of FNDC3B function displayed a reduction in
	stress fiber formation, indicating a role for FNDC3B in cell proliferation, adhesion, spreading and
	migration.
