Target Details

Background:	<p>Synonyms: KPL2, MGC102842, Protein KPL2, SPEF2, sperm flagellar protein 2, FLJ23164, FLJ23577, FLJ25395, KIAA1770, SPEF2_HUMAN.</p> <p>Background: Flagella and cilia are both membrane-bound projections from the cell surface that beat in distinctive patterns. Cilia are shorter and usually more profuse than flagella and contain a microtubule cytoskeleton, the ciliary axoneme, surrounded by a ciliary membrane. The ciliary membranes of all cilia hold specific receptors and ion channel proteins that initiate signaling pathways that regulate motility and/or link mechanical or chemical stimuli to intracellular transduction cascades regulating differentiation, migration and cell growth during development and in adulthood. KPL2, also known as SPEF2 (sperm flagellar 2), is a 1,822 amino acid protein that contains a calponin homology domain, three nuclear localization signals, a consensus P-loop and a proline-rich region. Required for correct axoneme development, KPL2 is predominantly expressed in cells with cilia or flagella. Four isoforms of KPL2 exist as a result of alternative splicing events.</p>
