	Background: PIST (PDZ protein interacting specifically with TC10), also known as GOPC (golgi
	associated PDZ and coiled-coil motif containing), CAL or FIG, is a 462 amino acid protein that
	localizes to the cytoplasm, as well as to the membrane of the golgi apparatus and to the cell
	junction. Expressed ubiquitously and containing one PDZ (DHR) domain, PIST functions as a
	homooligomer that interacts with a variety of proteins and plays a role in intracellular protein
	trafficking and degradation. Additionally, PIST is thought to regulate ionic currents via
	membrane channel modification and may also play a role in autophagy. Chromosomal
	aberrations in the gene encoding PIST are found in glioblastoma multiform (GBM), a common
	and aggressive form of brain tumor, suggesting a role for mutated PIST in carcinogenesis.
	Three isoforms of PIST exist due to alternative splicing events.
Pathways:	Maintenance of Protein Location, Asymmetric Protein Localization
