	Background: Glutamate receptors mediate most excitatory neurotransmission in the brain and
	play an important role in neural plasticity, neural development and neurodegeneration.
	lonotropic glutamate receptors are categorized into NMDA receptors and kainate/AMPA
	receptors, both of which contain glutamate-gated, cation-specific ion channels. Kainate/AMPA
	receptors are co-localized with NMDA receptors in many synapses and consist of seven
	structurally related subunits designated GluR-1 to -7. The kainate/AMPA receptors are primarily
	responsible for the fast excitatory neuro-transmission by glutamate whereas the NMDA
	receptors are functionally characterized by a slow kinetic and a high permeability for Ca2+ ions
	The NMDA receptors consist of five subunits: epsilion 1, 2, 3, 4 and one zeta subunit. The zeta
	subunit is expressed throughout the brainstem whereas the four epsilon subunits display
	limited distribution.
