Target Details

Background: The TRIAD3 gene encodes a cytoplasmic protein which specifically colocalizes
and interacts with the serine/threonine protein kinase, receptor-interacting protein (RIP). Zinc
finger domains of the encoded protein are required for its interaction with RIP and for inhibition
of TNF- and IL1-induced NF-kappa B activation pathways. The encoded protein may also
function as an E3 ubiquitin-protein ligase which accepts ubiquitin from E2 ubiquitin-conjugating
enzymes and transfers it to substrates. Several alternatively spliced transcript variants have
been described for this locus but the full-length natures of only some are known.
