	assembly factor-I p55 subunit, Nucleosome remodeling factor 55 kDa subunit, NURF 55, NURF-
	55, p55, Probable histone binding protein Caf1, VPRBP_HUMAN.
	Background: P55 is an extensively palmitoylated erythrocyte membrane protein, and a member
	of the MAGUK family. P55 also resists salt extraction, resulting in a high affinity for the plasma
	membrane. P55 contains a PDZ/DHR domain, a conserved SH-3 domain that appears to
	suppress tyrosine kinase activity of various oncoproteins, a 39-amino acid motif that binds to
	cytoskeletal protein 4.1R, and a guanylate kinase-like domain. Interaction with glycophorin C
	(GPC) and 4.1R suggests that p55 may play a role in the dynamic regulation in the erythrocyte
	membrane. In addition, p55 gene expression in vivo may be associated with a CpG island. P55
	is constitutively expressed in K562 erythroleukemia cells during erythropoiesis and undergoes a
	2-fold amplification after induction.
