	TSPAN5.
	Background: NET-4, also known as TSPAN5 or TM4SF9, is a 268 amino acid multi-pass
	membrane protein that belongs to the tetraspanin family and is thought to play a role in signal
	transduction events related to cell development, activation, growth and motility. The gene
	encoding NET-4 maps to human chromosome 4, which encodes nearly 6 $\%$ of the human
	genome and has the largest gene deserts (regions of the genome with no protein encoding
	genes) of all of the human chromosomes. Defects in some of the genes located on
	chromosome 4 are associated with Huntington's disease, Ellis-van Creveld syndrome,
	methylmalonic acidemia and polycystic kidney disease.
