	Background: The Ca2+/calmodulin-dependent protein kinases (CaM kinases) are a structurally	
	related subfamily of serine/threonine kinases that includes CaMKI, CaMKII, CaMKIV and	
	myosin light chain kinases (MYLK, also designated MLCK). The MYLK kinases phosphorylate	
	myosin regulatory light chains to catalyze myosin interaction with actin filaments resulting in	
	contractile activity. Non-muscle, smooth muscle and skeletal/cardiac muscle MYLK isoforms	
	exist. The MYLK gene (also designated MYLK1) encodes both smooth muscle and non-muscle	
	isoforms as well as telokin, a small C-terminal isoform expressed only in smooth muscle with	
	the capacity to stabilize unphosphorylated myosin filaments. Multiple transcript variants are	
	described for the MYLK gene. Smooth-muscle and non-muscle MYLK isoforms are expressed	
	in a wide variety of adult and fetal tissues. The skeletal/cardiac muscle isoforms of MYLK are	
	encoded by a separate gene, MYLK2 (also designated skMLCK). MYLK appears to be a target	
	for PAKs (p21-activated kinases). PAK1 interaction with MYLK results in a decrease in MYLK	
	activity and myosin light chain phosphorylation.
