	Background: The Insulin-like growth factor binding proteins, or IGFBPs, are a family of seven
	proteins that have co-evolved with the IGFs. IGFBPs serve as shuttle molecules for both IGF-I
	and IGF-II and confer a level of regulation to the IGF signaling system by influencing the bio-
	availability, concentration and distribution of IGFs in the extracellular environment. In human
	circulation, the IGF-binging protein complex requires ALS (IGFBP acid-labile subunit), an
	extracellular protein involved in receptor-ligand binding and cell adhesion. ALS, detected
	primarily in plasma, is involved in protein-protein interactions that result in the formation of
	protein complexes.
