| Alternative Name:                                      | Lyl1 (LYL1 Products)   |
|--|--|
| Background:  | Synonyms: Lyl1; Lymphoblastic leukemia derived sequence 1; Protein lyl 1.  |
|  | Background: The Lyl1 gene encodes a basic helixloophelix transcription factor involved in T-cel  |
|  | acute lymphoblastic leukemia. The expression of Lyl1 is at higher levels in the majority of cases  |
|  | of acute myeloblastic leukemia (AML) or myelodysplastic syndrome when compared to norma  |
|  | bone marrow. Lyl1 is highly expressed in most AML cell lines.Lyl-1, TAL1 and TAL2 are part of a  |
|  | family of basic helix-loop-helix (bHLH) proteins implicated in T cell acute leukemia. TAL1, also   |
|  | designated SCL, is a serine phosphoprotein and basic helix-loop-helix transcription factor   |
|  | known to regulate embryonic hematopoiesis. TAL2 is a protein involved in T cell acute  |
|  | lymphoblastic leukemia through a chromosomal translocation involving TAL2 and T cell   |
|  | receptor chain genes. TAL2 includes a helix-loop-helix protein dimerization and DNA-binding  |
|  | domain that is homologous to TAL1 and Lyl-1 proto-oncogenes. Lyl-1 (lymphoblastic leukemia-  |
|  | derived sequence 1) is a nuclear protein. Endogenous Lyl-1 exists in complex with E2å proteins   |
|  | Lyl-1 and E2å protein can form heterodimeric complexes with distinctive DNA-binding  |
|  | properties in hematolymphoid cells. Lyl-1 is involved in a chromosomal aberration which  |
|  | causes a form of T cell acute lymphoblastic leukemia (T-ALL).  |
