Target Details

Alternative Name:	Gbx2 (GBX2 Products)
Background:	Synonyms: Gastrulation and brain-specic homeobox protein 2, Gastrulation brain homeo box 2
	Gastrulation brain homeo box 2, gbx2, GBX2_HUMAN, Homeobox protein GBX 2, Homeobox
	protein GBX 2, Homeobox protein GBX-2, Homeobox protein STRA7, Mmoxa.
	Background: The isthmic organizer signals at the mid/hindbrain boundary (MHB) regulate the
	development and differentiation of the vertebrate caudal midbrain and the anterior hindbrain.
	The MHB forms at the boundary of expression between homeobox genes Gbx2 and Otx2. Gbx2
	and Otx2 play distinct, essential roles in MHB positioning and development. During
	development, the GBX2 gene is expressed in the anterior hindbrain. Specifically, Gbx2
	negatively regulates Otx2 expression along the anterior-posterior axis, Gbx2(-) mutants
	demonstrate an expanded Otx2 domain. During development, the GBX2 gene is expressed in
	the anterior hindbrain. Gbx2 is expressed in the adult brain, spleen and female genital tract. The
	GBX2 gene is over-expressed in human prostate cancer cell lines (TSU-prl, PC3, DU145 and
	LNCaP). Furthermore, downregulation of Gbx2 expression restricts tumorigenicity in human
	prostate cancer cell lines, which suggests that Gbx2 expression may be required for growth of
	malignant prostate cells.
