antibody Peptidase inhibitor 7, Pi-7, Plasminogen activator inhibitor type 1, member 2, PN-1,
PN1, PNI, Protease nexin 1, Protease nexin I, Serpin E2, Serpin peptidase inhibitor, clade E nexin,
plasminogen activator inhibitor type 1, member 2, SERPINE 2, Serpine2.
Background: The serine protease inhibitors (serpins) compose a superfamily of proteins with a
diverse set of functions, including the control of blood coagulation, complement activation,
programmed cell death and development. Serpins are secreted glycoproteins that contain a
stretch of peptide that mimics a true substrate for a corresponding serine protease. Protease
nexin-1 (PN-1) is a serpin that inactivates several proteases, including thrombin, urokinase,
plasminogen activators (PA) and plasmin. It is involved in tissue remodeling, cellular
invasiveness, matrix degradation and tumor growth. PN-1 expression is abundant in the
nervous system, where it inhibits thrombin, thereby playing a role in neural injury and repair
processes. An imbalance between PN-1 and thrombin may be a contributing factor in the
pathology of Alzheimer??s disease.
