## Target Details

Alternative Name: GMF beta ([GMFB Products](#))

Background: Synonyms: Glia maturation factor beta, GMF. GMF-beta, GMFB, GMFB\_HUMAN.  
Background: Glia maturation factor \_ (GMF-) belongs to the GMF subfamily of the larger actin-binding protein ADF family. This protein, which is phosphorylated following phorbol ester stimulation, is important for the nervous system. It causes brain cell differentiation, stimulates neural regeneration and inhibits tumor cell proliferation. Overexpression of GMF in astrocytes has been shown to enhance brain-derived neurotrophic factor (BDNF) production. GMF expression is increased by exercise, and the protein is crucial for exercise-induction of BDNF. Through BDNF production, GMF appears to play a role in neuroprotection. In thymoma, T-cell development is maintained by GMF- being produced by the tumor cells.
