	Background: Cyclic nucleotide-gated (CNG) cation channels are heteromeric complexes made
	up of principal alpha and modulatory beta subunits (1,2). The alpha subunits consist of CNG1
	and form functional cation channels by themselves (1,2). The beta subunits consist of CNG4-
	and, unlike the alpha subunits, do not form functional channels, but rather modify the properti
	of channels (1,2). CNG channels are essential components of olfactory and visual transductio
	(1,2). In olfactory neurons, CNG2, CNG4.3 and CNG5 form Ca2+ permeable channels, which
	open and depolarize the cell in response to cAMP (1-3). In rod photoreceptors, CNG1 and
	CNG4.1 combine to form Ca ion permeable channels, which give rise to a current in response
	cGMP (1-3). CNG3 and CNG6 are expressed in cone receptors and may combine to form a
	native cGMP-activated channel (2,3). CNG channels have been implicated in other areas (4-6)
	CNG1 is also expressed in medium-sized and small-sized arteries, suggesting a role for CNG i
	the regulation of arterial blood pressure and of blood supply to different regions (4). CNG1,
	CNG4.1 and CNG4.2 have been detected in the rat pineal gland (5). CNG2, CNG4.3 and CNG5
	are present in GT1 cell lines and may play a role in the secretion of gonadotropin-releasing
	hormone (6).
