Target Details	
Alternative Name:	HEXDC (HEXDC Products)
Background:	Synonyms: Beta hexosaminidase D, Beta N acetylhexosaminidase, FLJ23825, Hexosaminidase
	glycosyl hydrolase family 20 catalytic domain containing, hexosaminidase glycosyl hydrolase
	family 20, catalytic domain, Hexosaminidase D, Hexosaminidase domain containing protein, N
	acetyl beta galactosaminidase, HEXDC_HUMAN.
	Background: HEXDC, also known as hexosaminidase D, beta-hexosaminidase D, N-acetyl-beta-
	galactosaminidase, hexosaminidase domain-containing protein or beta-N-
	acetylhexosaminidase, is a 486 amino acid cytoplasmic and nuclear protein that has
	hexosaminidase activity and belongs to the glycosyl hydrolase 20 family. Existing as two
	alternatively spliced isoforms, HEXDC catalyzes the hydrolysis of non-reducing N-acetyl-D-
	hexosamine residues near the termini of N-acetyl-beta-D-hexosaminides. The gene encoding
	HEXDC maps to human chromosome 17, which comprises over 2.5 % of the human genome
	and encodes over 1,200 genes. Two key tumor suppressor genes are associated with
	chromosome 17, namely, p53 and BRCA1. Defects in p53 is associated with malignant cell
	growth and Li-Fraumeni syndrome. BRCA1 is directly involved in DNA repair and is recognized
	as a genetic determinant of early onset breast cancer and predisposition to cancers of the
	ovary, colon, prostate gland and fallopian tubes.
Gene ID:	284004
