| | Background: OLFM3 is a 478 amino acid protein that interacts with myocilin. Myocilin is an |
| | extracellular protein that plays a key role in the actomyosin system and is responsible for |
| | controlling intraocular pressure. OLFM3 is a secreted protein that contains an olfactomedin-like |
| | (OLF) domain, an approximately 260 amino acid motif commonly found in secreted |
| | glycoproteins. OLFM3 localizes to the Golgi apparatus of the cell and is highly expressed in |
| | both eye and brain tissue. Mutations in the gene that encodes OLFM3 may cause severe |
| | glaucoma, a condition in which increased intraocular pressure within the eyeball causes loss of |
| | eye sight. |
