Background:	Synonyms: hNT, IgLON family member 2, IGLON2, Neurotrimin, NT antibody NTM,			
	NTRI_HUMAN. Background: Cell adhesion molecules (CAMs) influence cell growth, differentiation,			
	embryogenesis, immune response and cancer metastasis by networking information from the			
	extracellular matrix to the cell. The four major families of cell adhesion molecules are			
	immunoglobulin (Ig) superfamily (calcium-independent transmembrane glycoproteins), integrins (transmembrane non-covalently linked heterodimers of Alpha and Beta subunits), calcium-dependent cadherins and divalent cation-dependent selectins. Regulation of neuronal synaptic adhesion by CAMs has proven important for learning and memory. Proper embryonic			
	morphogenic development is also heavily dependent on the regulation of cell adhesion			
	molecules. Neurotrimin (hNT) is a neural cell adhesion molecule localizing to the cell			
	membrane, where it acts as a lipid-anchor. Neurotrimin belongs to the IgLON family of proteins,			
	a member of the larger immunoglobulin superfamily.
