## Target Details

	adhesion proteins that contain up to seven extracellular domains and are predominantly
	expressed in the nervous system. Importantly, the adhesion mechanism of protocadherins is
	distinct from classic cadherins. Through inactivation or overexpression, several protocadherins
	have been implicated in a variety of cancers. PCDH7 (protocadherin 7), also known as BHPCDH
	or BH-Pcdh, is a 1069 amino acid single-pass I membrane protein that is expressed in the brain
	and heart. Containing seven cadherin domains, PCDH7 is thought to function in cell-cell
	recognition and adhesion. PCDH7 exists as three isoforms due to alternative splicing events.
