Background:Synonyms: DKFZp434G0420, FLJ10067, GC17P078009, IOP2, Iron only hydrogenase like

NARF_HUMAN.Background: Prenylation and methylation are two forms of protein modification, both of which
are important for a variety of functions, including membrane attachment, protein-protein
interactions and signaling events. NARF (nuclear prelamin A recognition factor), also known as
IOP2, is a 456 amino acid nuclear protein that belongs to the NARF family. Expressed
ubiquitously with highest expression in heart, skeletal muscle and brain, NARF binds to the C-
terminal end of prenylated prelamin A and may be a member of a prelamin A-containing
endoprotease complex. Additionally, via its association with prelamin A, NARF may be involved
in heterochromatin organization. NARF is expressed as three isoforms due to alternative
splicing events and, upon DNA damage, may be phosphorylated by ATM or ATR.
