| | Background: The endoplasmic reticulum exerts a quality control over newly synthesized | | |
| | proteins and a variety of components have been implicated in the specific recognition of | | |
| | aberrant or misfolded polypeptides. Signal peptide peptidase (SPP) catalyzes intramembrane | | |
| | proteolysis of some signal peptides after they have been cleaved from a preprotein, resulting in | | |
| | the release of the fragment from the ER membrane into the cytoplasm. SPP is required to | | |
| | generate lymphocyte cell surface (HLA-E) epitopes derived from MHC class I signal peptides, | | |
| | and may play a role in graft rejection. It also may be necessary for the removal of the signal | | |
| | peptide that remains attached to the hepatitis C virus core protein after the initial proteolytic | | |
| | processing of the polyprotein. | | |
