| | Microcephaly primary autosomal recessive 1. | |
| | Background: Microcephalin modulates brain size and has been proliferating under strong | |
| | positive selection for several thousand years, although the nature of the positive selection is | |
| | poorly understood. Human Microcephalin contains three BRCA1 C-terminal (BRCT) domains | |
| | and shares 57 % identity with its mouse ortholog, the most conserved regions being BRCT | |
| | domains where there is 80 % identity. Predominant expression of human Microcephalin is | |
| | observed in fetal brain, liver and kidney tissues and is expressed during neurogenesis in mice. | |
| | Microcephalin displays significantly higher rates of protein evolution in primates than in | |
| | rodents, this trend is most noticeable for the subset of genes associated with nervous system | |
| | development. Microcephalin has a very young, single nucleotide, polymorphism haplotype | |
| | associated with modern humans, this gene is presumably still evolving in Homo sapiens. It | |
| | functions in DNA damage response and regulation of cell cycle checkpoints. | |
