Target Details		
Background:	Synonyms: BRCT repeat inhibitor of TERT expression 1, BRIT 1, FLJ12847, Hypothetical protein	
	FLJ12847, MCPH 1, MCPH1, MCPH1_HUMAN, MCT antibody Microcephalin 1, Microcephalin-1	
	Microcephaly primary autosomal recessive 1.	
	Background: Microcephalin modulates brain size and has been proliferating under strong	
	positive selection for several thousand years, although the nature of the positive selection is	
	poorly understood. Human Microcephalin contains three BRCA1 C-terminal (BRCT) domains	
	and shares 57 % identity with its mouse ortholog, the most conserved regions being BRCT	
	domains where there is 80 % identity. Predominant expression of human Microcephalin is	
	observed in fetal brain, liver and kidney tissues and is expressed during neurogenesis in mice.	
	Microcephalin displays significantly higher rates of protein evolution in primates than in	
	rodents, this trend is most noticeable for the subset of genes associated with nervous system	
	development. Microcephalin has a very young, single nucleotide, polymorphism haplotype	
	associated with modern humans, this gene is presumably still evolving in Homo sapiens. It	
	functions in DNA damage response and regulation of cell cycle checkpoints.	
Pathways:	Stem Cell Maintenance
