Background:	Synonyms: EDN2, EDN2_HUMAN, Endothelin 2, Endothelin-2, ET 2, ET-2, ET2, PPET2, Preproendothelin 2, Preproendothelin-2.		
	Background: The endothelin (ET) family of proteins, which includes ET-1 (endothelin-1), ET-2		
	(endothelin-2) and ET-3 (endothelin-3), are vasoactive peptides that are involved in various		
	functions throughout the body. Endothelins can affect the central nervous system and neuronal		
	excitability, and they elicit potent vasoconstrictor action. While ET-1 is a potent, 21-amino acid		
	vasoconstrictor peptide, ET-2 has the most potent vasoconstrictor activity. ET-3 functions as a		
	ligand for endothelin receptor type B (ETBR) and, through this interaction, mediates the		
	maturation of enteric neurons and melanocytes. Although ET-3 is expressed as a 238 amino		
	acid peptide, it is post-translationally modified to produce a short active isoform and a long		
	inactive isoform. Defects in the gene encoding ET-3 are the cause of a variety of disorders,		
	including Hirschsprung disease type 1 (HSCR1), congenital central hypoventilation syndrome		
	(CCHS) and Waardenburg syndrome type IV (WS4).
