Background:	Synonyms: EDN2, EDN2_HUMAN, Endothelin 2, Endothelin-2, ET 2, ET-2, ET2, PPET2,	
	Preproendothelin 2, Preproendothelin-2.	
	Background: The endothelin (ET) family of proteins, which includes ET-1 (endothelin-1), ET-2	
	(endothelin-2) and ET-3 (endothelin-3), are vasoactive peptides that are involved in various	
	functions throughout the body. Endothelins can affect the central nervous system and neuronal	
	excitability, and they elicit potent vasoconstrictor action. While ET-1 is a potent, 21-amino acid	
	vasoconstrictor peptide, ET-2 has the most potent vasoconstrictor activity. ET-3 functions as a	
	ligand for endothelin receptor type B (ETBR) and, through this interaction, mediates the	
	maturation of enteric neurons and melanocytes. Although ET-3 is expressed as a 238 amino	
	acid peptide, it is post-translationally modified to produce a short active isoform and a long	
	inactive isoform. Defects in the gene encoding ET-3 are the cause of a variety of disorders,	
	including Hirschsprung disease type 1 (HSCR1), congenital central hypoventilation syndrome	
	(CCHS) and Waardenburg syndrome type IV (WS4).	
Pathways:	Hormone Activity, Negative Regulation of Hormone Secretion, Regulation of Systemic Arterial	
	Blood Pressure by Hormones
