	Background: The Ras superfamily of GTPases can be subdivided into the Ras, Rho/Rac, Sar,		
	Rab, Arf, Rap and Ran subfamilies, all of which control multiple aspects of cell function,		
	including cytoskeletal rearrangement, nuclear signaling and cell growth. The Ras superfamily of		
	GTPases function as regulated switches that toggle between a biologically active GTP-bound		
	and an inactive GDP-bound form. This activation is catalyzed by guanine nucleotide exchange		
	factors (GEFs). RIC-8A (resistance to inhibitors of cholinesterase 8 homolog A), also known as		
	RIC8 or Synembryn-A, is a 530 amino acid cytoplasmic protein that can activate several G-alpha		
	proteins, including G?i-1, G?q and G?o. Functioning as a guanine nucleotide exchange factor,		
	RIC-8A binds to GDP-associated substrates and exchanges bound GDP for free GTP. Via its		
	ability to stimulate protein function, RIC-8A plays a role in regulating mitotic movement and		
	may be involved in receptor-mediated ERK activation. RIC-8A is expressed as three isoforms		
	due to alternative splicing events.		
Pathways:	Regulation of G-Protein Coupled Receptor Protein Signaling, Feeding Behaviour, Asymmetric		
	Protein Localization
