	Background: The inositol polyphosphate 5-phosphatases selectively remove the phosphate	
	from the 5-position of various phosphatidylinositols, which generate second messengers in	
	response to extracellular signals. Synaptojanins are characterized by an N-terminal SAC1-like	
	sequence, a central 5-phosphate domain, and a unique C-terminal sequence and have been	
	shown to use phosphatidylinositol 4,5-bisphosphate as a substrate. Synaptojanins exist as two	
	isoforms, synaptojanin 1 and 2, which differ in the C-terminal domain, and each isoform has	
	multiple variants produced by alternative splicing. Synaptojanin 1 is expressed as two major	
	forms: the shorter is found in brain while the longer is expressed in peripheral tissues. Eight	
	splice variants of synaptojanin 2 have been detected, including a brain specific isoform.	
	Synaptojanins are thought to participate in the endocytosis of synaptic vesicles and the	
	regulation of the actin cytoskeleton.
