| | Background: 17beta-HSD8 belongs to the 17beta-HSD family of proteins that regulate the |
| | availability of steroids within a tissue. 17beta-HSD8 converts active steroids to their inactive |
| | form through its oxidative activity. It is a key player in the inactivation of Estradiol and |
| | Testosterone. 17beta-HSD8 is predominantly expressed in placenta, endometrium and prostate |
| | but can also be found in liver, and pancreas, with lowest levels found in testis, ovary and kidney. |
| | It has been proposed that a reduction in the levels of 17beta-HSD8 may lead to abnormal |
| | elevations in the local level of sex steroids, which can lead to recessive renal cystic disease. It |
| | has also been suggested that low levels of 17beta-HSD proteins may result in an |
| | underdeveloped urogenital system. |
