| | Background: Bardet-Biedl syndrome (BBS) is a pleiotropic genetic disorder characterized by |
| | obesity, photoreceptor degeneration, polydactyly, hypogenitalism, renal abnormalities, and |
| | developmental delay. BBS patients also have an increased risk of developing diabetes, |
| | hypertension, and congenital heart defects. BBS is a heterogeneous disorder mapping to eight |
| | genetic loci and encoding eight proteins, BBS1-BBS8. Five BBS proteins encode basal body or |
| | cilia proteins, suggesting that BBS is a ciliary dysfunction disorder. BBS2 contains two |
| | overlapping genes: BBS2L1 and BBS2L2. BBSL1 was re-named BBS7, whereas BBS2L2 |
| | independently funcitons as BBS1. BBS7 contains 672 amino acids and is expressed at low to |
| | moderate levels in most human tissues. |
