Background: Pancreatic polypeptide (PP), neuropeptide Y (NPY), and peptide YY (PYY) are
related 36-amino acid hormones. A number of structurally related receptors for these peptides
have been isolated, NPY1-R, NPY2-R, NPY3-R, NPY4-R, NPY5-R, and NPY6-R. NPY4-R is
expressed in several human tissues, including brain, coronary artery, and ileum. NPY4-R maps
to human chromosome 10q11.2. NPY-5R, isolated from rat hypothalamus, encodes a 456-
amino acid protein with less than 35 % overall identity to known Y-type receptors. The human
NPY5-R sequence is nearly identical to, but in the opposite orientation from, that of the human
NPY1-R sequence. NPY5-R localizes to the paraventricular hypothalamic nucleus, the lateral
hypothalamus, and other locations consistent with a role in the control of feeding behavior. The
gene which encodes NPY5-R maps to human chromosome 4q32.2. NPY6-R is abundantly
expressed in human heart and skeletal muscle and the gene which encodes NPY6-R maps to
human chromosome 5q31.
