	Galanin receptor family member 3, Galanin receptor type 3, GALN R3, GALNR 3, GALNR3, GALR	
	3, GALR-3, Galr3, GALR3_HUMAN.	
	Background: GALR3 a 368 and 370 amino acid protein in human and rat, respectively, belongs	
	to a family of G protein-coupled receptors that bind the neuropeptide galanin, which is	
	distributed throughout the central and peripheral nervous system, the pituitary gland, the	
	gastrointestinal tract and in the endocrine and exocrine pancreas. GALR3 mRNA is widely	
	distributed, but expressed at low abundance. In human, GALR3 mRNA is highly expressed in the	
	hypothalamus, pituitary and testis, and is expressed to a lesser extent in adrenal gland and	
	pancreas. Rat and human GALR3 co-express with potassium channel subunits GIRK1 and	
	GIRK4. Like GALR1, GALR3 signaling pathways lead to the inhibition of adenylate cyclase and to	
	the activation of potassium channels, which are linked to the regulation of neurotransmitter	
	release. Binding of galanin to galanin receptors results in increased feeding, impaired learning,	
	enhanced opiate analgesia and decreased opiate place preference.
