Target Details

Background:	<p>Synonyms: Calcipressin-3, Down syndrome candidate region 1 like 2, regulator of calcineurin 3, Down syndrome candidate region 1 like protein 2, Down syndrome candidate region 1-like protein 2, Down syndrome critical region gene 1 like 2, DSCR1L2, hRCN3, MCIP3, Myocyte enriched calcineurin interacting protein 3, Myocyte-enriched calcineurin-interacting protein 3, RCAN family member 3, RCAN3, RCAN3_HUMAN, RCN3, Regulator of calcineurin 3.</p> <p>Background: Calcineurin is a Ca(2+) dependent protein phosphatase that is involed in several neuornal functions. Proteins belonging to the RCAN (Regulator of calcineurin) family modulate the activity of Calcineurin through a valine-rich region within their carboxyl tail. RCANs compete with NFATs (Nuclear factor of activated T-cells) for binding to the same docking site in calcineurin, which results in either inhibition or activation of calcineurin activity. Calcipressin-2, also known as RCAN2 and DSCR1L1 (Down syndrome candidate region 1-like 1), is a 197 amino acid protein that is highly expressed in both the cytoplasm and nucleus of neurons and is the only RCAN family member that is found in glial cells. Calcipressin-3, also known as RCAN3 and DSCR1L2 (Down syndrome candidate region 1-like protein 2), is a 241 amino acid protein that potentially is involved in central nervous system development. Calcipressin-3 interacts with cardiac troponin I, suggesting that it may play a role in cardiac contraction events.</p>
