|                     | Background: The Ras p21 family of guanine nucleotide proteins has been widely studied in view |
|                     | of its apparent role in signal transduction pathways and high frequency of mutations in human |
|                     | malignancies. It is now clear, however, that the Ras proteins (H-, K- and N-Ras p21) are      |
|                     | members of a much larger superfamily of related proteins. Six members of this family, Rap 1A, |
|                     | Rap 1B, Rap 2, R-Ras, Ral A and Ral B, exhibit approximately 50 % amino acid homology to Ras. |
|                     | The six mammalian Rho proteins (Rho A, B, C, G, 7 and 8) are approximately 30 % homologous    |
|                     | to Ras and are expressed in a wide range of cell types. Both Ras p21 and Rho p21, as well as  |
|                     | other members of the Ras superfamily, contain a carboxy-terminal CAAX sequence (C, cysteine,  |
|                     | A, aliphatic amino acid, X, any amino acid) which in the case of Ras has been shown to be     |
|                     | essential for correct localization and function.  |
