Target Details

Background:	<p>Synonyms: CP11, homeo box C5, homeobox C5, Homeobox protein CP11, homeobox protein Hox C5, Homeobox protein Hox-3D, Homeobox protein Hox-C5, Hox 3D, HOX3, HOX3D, HOXC5, HXC5_HUMAN, OTTHUMP00000217386.</p> <p>Background: The Hox homeobox genes encode proteins that are transcriptional regulators with an established role in embryonic development. HoxC5 is a 222 amino acid protein that localizes to the nucleus and contains one homeobox DNA-binding domain. Existing as multiple alternatively spliced isoforms, HoxC5 functions as a sequence-specific DNA-binding transcription factor that is part of a regulatory mechanism that provides cells with positional identities during development. The gene encoding HoxC5 maps to a cluster of Hox proteins on chromosome 12 that are essential for morphogenesis. Encoding over 1,100 genes within 132 million bases, chromosome 12 makes up about 4.5 % of the human genome. A number of skeletal deformities are linked to chromosome 12, including hypochondrogenesis, achondrogenesis and Kniest dysplasia.</p>
