Target Details

Background:	<p>Synonyms: Clathrin assembly lymphoid myeloid leukemia, Clathrin assembly lymphoid myeloid leukemia protein, CLTH, LAP, Phosphatidylinositol-binding clathrin assembly protein, PICAL_HUMAN, PICALM.</p> <p>Background: Clathrin-coated pits and vesicles are assembled for receptor-mediated endocytosis through interaction with clathrin associated protein complexes. Vesicle transport is mediated from the trans-Golgi network by the adapter complex AP-1 and from the plasma membrane by the AP-2 complex. The AP-1 and AP-2 adapter protein complexes consist of clathrin binding adaptin proteins and two smaller subunits known as AP50 and AP17. The Alpha- and Beta-Adaptin chains have a similar two-domain organization with C-terminal domains that vary in both sequence and length. Alpha-Adaptin splice variants A and C display variable relative expression levels and differential distribution in different tissues. AP180 (also designated AP-3 or F1-20) is a synapse-specific clathrin assembly protein. The protein CALM (clathrin assembly protein lymphoid myeloid leukemia) is highly homologous to AP180 and may also be involved in clathrin assembly.</p>
