Background:	Synonyms: En 1, EN1, Engrailed 1, Engrailed, Engrailed homeobox 1, Engrailed homolog 1,
Dackyrounu.	HME1_HUMAN, Homeobox protein en-1, Homeobox protein engrailed 1, Homeobox protein
	engrailed-1, Hu-En-1, Mo-en.1.
	Background: The engrailed-1 gene, EN1, a murine homolog of the Drosophila homeobox gene
	engrailed (EN), is required for midbrain and cerebellum development and dorsal/ventral
	patterning of the limbs as well as apical ectodermal ridge formation. In Drosophila, the EN gene
	plays an important role during development in segmentation, where it is required for the
	formation of posterior compartments. Human EN-1 and EN-2 are homeodomain-containing
	proteins and have been implicated in the control of pattern formation during development of
	the central nervous system. Different mutations in the mouse homo-logs, EN-1 and EN-2,
	produce different developmental defects that frequently are lethal. EN-1 is highly expressed by
	essentially all dopaminergic neurons in the substantia nigra and ventral tegmentum. EN-1 and
	EN-2 regulate expres-sion of a-synuclein, a gene that is genetically linked to Parkinson?s disease.
