Background:	Synonyms: HSS, SFMD, MPS3A, N-sulphoglucosamine sulphohydrolase, Sulfoglucosamine sulfamidase, Sulphamidase, SGSH	
	Background: Sulfatases are enzymes that hydrolyse a diverse range of sulfate esters.	
	Deficiency of lysosomal sulfatases leads to human diseases characterized by the accumulation	
	of either GAGs (glycosaminoglycans) or sulfolipids. Sulfamidase, also known as HSS, SFMD,	
	MPS3A or SGSH, is a 502 amino acid lysosome that belongs to the sulfatase family. It has been	
	suggested that sulfamidase may be involved in the lysosomal degradation of heparan sulfate.	
	Defects in the gene encoding sulfamidase are the cause of Sanfilippo syndrome A, an	
	autosomal recessive lysosomal storage disease caused by impaired degradation of heparan	
	sulfate. Sanfilippo syndrome A is characterized by severe central nervous system degeneration	
	but relatively mild somatic manifestations.
