Background:	Synonyms: LIM homeo box transcription factor 1 beta, LIM homeobox transcription factor 1
	beta, LIM homeobox transcription factor 1-beta, LIM-homeobox protein 1.2, LIM/homeobox
	protein 1.2, LIM/homeobox protein LMX1B, LMX 1.2, LMX-1.2, LMX1.2, LMX1B,
	LMX1B_HUMAN, NPS 1, NPS1.
	Background: Nail-patella syndrome (NPS) is an autosomal dominant disorder characterized by
	dyplasia of finger nails, skeletal anomalies and, frequently, renal disease. NPS is caused by
	putative loss-of-function mutations in the transcription factor LMX1B. LMX1B belongs to the
	LIM-homeodomain family, members of which are known to be important for pattern formation
	during development. Twenty-two novel mutations may occur in the gene encoding LMX1B and
	the type and distribution of the mutations support the hypothesis that NPS is the result of
	haploinsufficiency for LMX1B. LMX1B is also necessary for normal development of the eye and
	in regulating dopaminergic neurogenesis and may be involved in developmental glaucoma and
	the aetiology of idiopathic Parkinson?s disease. Specifically, LMX1B along with LIM1 control the
	initial trajectory of motor axons in the developing mammalian limb. In addition, LMX1B directly
	regulates the coordinated expression of alpha 3(IV) and alpha 4(IV) collagen required for
	normal glomerular basement membrane (GBM) morphogenesis, and the dysregulation of
	LMX1B in GBM contributes to the renal pathology and nephrosis in NPS.
