## Target Details

# Background:Synonyms: ARHGEF25, ARHGP\_HUMAN, GEFT, p63RhoGEF, Guanine nucleotide exchange<br/>factor GEFT, p63RhoGEF, RAC/CDC42 exchange factor, Rac/Cdc42/Rho exchange factor<br/>GEFT, Rho guanine nucleotide exchange factor 25, RhoA/RAC/CDC42 exchange factor,<br/>RhoA/Rac/Cdc42 guanine nucleotide exchange factor GEFT.<br/>Background: GEFT is a 580 amino acid cytoplasmic protein that is highly expressed in excitable<br/>tissues such as brain, heart and muscle, and weakly expressed in small intestine, colon, liver,<br/>placenta and lung. GEFT may play a role in actin cytoskeleton reorganization in different tissues<br/>since its activation induces formation of actin stress fibers. GEFT works as a guanine<br/>nucleotide exchange factor for the Rho family of small GTPases and links specifically to G<br/>alpha q/11-coupled receptors in Rho A activation. GEFT is an important regulator of processes<br/>involved in axon and dendrite formation. Involved in skeletal myogenesis, GEFT seems to be an<br/>exchange factor primarily for Rac 1 in neurons. Existing as two alternatively spliced variants,<br/>GEFT contains a DH (DBL-homology) domain and a PH domain.
