	Huntingtin-associated protein-interacting protein, Kalirin isoform 2, Kalirin, KALRN ,		
	KALRN_HUMAN , Protein Duo, RhoGEF kinase, Serine/threonine kinase with Dbl and pleckstrin		
	homology domains , Serine/threonine-protein kinase with Dbl- and pleckstrin homology domain		
	TRAD.		
	Background: HAP1 (huntingtin-associated protein 1) binds to huntingtin (1). Huntingtin is a		
	protein that contains a polyglutamine region and when the number of glutamine repeats		
	exceeds 35, the gene encodes a version of huntingtin that leads to Huntington?s disease (HD)		
	(2,3). The ability of HAP1 to bind to huntingtin is enhanced by an expanded polyglutamine		
	repeat region (1). HAP1 shows neuronal localization and moves with huntingtin in nerve fibers		
	(4,5). HAP1 is primarily expressed in brain tissue, with greater expression in the olfactory bulb		
	and brain stem (1). Mouse HAP1 is localized to membrane-bound organelles including large		
	endosomes, tubulovesicular structures and budding vesicles in neurons (6). Duo, also		
	designated huntingtin-associated protein interacting protein or HAPIP, binds Huntingtin-		
	associated protein 1 (HAP1) and may have a role in vesicle trafficking and cytoskeletal function		
Pathways:	Neurotrophin Signaling Pathway
