# Background:Synonyms: Leucine rich repeat LGI family member 3; Leucine-rich glioma inactivated protein 3;<br/>Leucine-rich glioma-inactivated protein 3; Leucine-rich repeat LGI family member 3; LGI1 like<br/>protein 4; LGI1-like protein 4; LGI3; LGI3\_HUMAN; LGIL4.<br/>Background: The leucine-rich (LRR) repeat is a 20-30 amino acid motif that forms a<br/>hydrophobic å/ horseshoe fold, allowing it to accommodate several leucine residues within a<br/>tightly packed core. All LRR repeats contain a variable segment and a highly conserved<br/>segment, the latter of which accounts for 11 or 12 residues of the entire LRR motif. Leucine-rich<br/>glioma-inactivated protein 3 (LGI3), also known as LGI1-like protein 4 (LGIL4) or leucine-rich<br/>repeat LGI family member 3, is a 548 amino acid secretory protein. LGI3 contains five LRR<br/>repeats and seven EAR repeats. Widely expressed, with highest levels in brain and lung, LGI3<br/>has been shown to colocalize with endocytosis-associated proteins, lipid raft markers, and<br/>Syntaxin. The gene encoding LGI3 maps to chromosome 8p21.3.
