Background:Synonyms: Leucine rich repeat LGI family member 3; Leucine-rich glioma inactivated protein 3;
Leucine-rich glioma-inactivated protein 3; Leucine-rich repeat LGI family member 3; LGI1 like
protein 4; LGI1-like protein 4; LGI3; LGI3_HUMAN; LGIL4.
Background: The leucine-rich (LRR) repeat is a 20-30 amino acid motif that forms a
hydrophobic å/ horseshoe fold, allowing it to accommodate several leucine residues within a
tightly packed core. All LRR repeats contain a variable segment and a highly conserved
segment, the latter of which accounts for 11 or 12 residues of the entire LRR motif. Leucine-rich
glioma-inactivated protein 3 (LGI3), also known as LGI1-like protein 4 (LGIL4) or leucine-rich
repeat LGI family member 3, is a 548 amino acid secretory protein. LGI3 contains five LRR
repeats and seven EAR repeats. Widely expressed, with highest levels in brain and lung, LGI3
has been shown to colocalize with endocytosis-associated proteins, lipid raft markers, and
Syntaxin. The gene encoding LGI3 maps to chromosome 8p21.3.
