	Background: Human Pecanex proteins are homologs of the Drosophila Pecanex protein, a
	maternal-effect neurogenic protein that is involved in normal development of the fly nervous
	system. Three human Pecanex homologs exist, designated Pecanex, Pecanex 2, also known as
	PCNXL2 (pecanex-like 2), and Pecanex 3. Pecanex 2 is a 2,137 amino acid multi-pass
	membrane protein that exists as five alternatively spliced isoforms characterized by high
	mutational frequencies and biallelic mutations in colorectal tumors, thereby likely functioning
	as a target gene in these tumors. Pecanex 2 is encoded by a gene that maps to human
	chromosome 1q42.2, which is linked to an inherited microduplication. This microduplication
	that includes Pecanex 2 may play a role in autism and mild mental retardation.
